

## NEW 100% ANTI-BACTERIALLY TREATMENT

Costan present new Epta 100% Anti-bacterially treatment , an innovative antibacterial treatment for traditional units using silver ions. Available for chest and display shelves, this is a new way of improving the quality and reducing degradation of products on display, with a notable increase in food conservation times. Silver is a natural basic inhibitor that can impede the enzymes necessary for bacteria and parasites to develop. Thanks to its antibacterial properties, the treatment can act on the of cold air flowing around the foodstuffs. The unit materials are treated during the extrusion and coating processes, to ensure maximum effectiveness. The combination of these two treatments reduces the bacteria dispersed in the air, thereby ensuring better quality of the air in direct contact with food and, consequently, reduced degradation of goods on display.
